Ruhan Wang

Computer Engineering Ph.D. | LLM Agents, Reinforcement Learning & Scalable Post-Training

ruhwang@iu.edu | +1 812 327 8256 | LinkedIn | GitHub | Google Scholar | Homepage

PROFESSIONAL PROFILE

Computer Engineering Ph.D. working on **long-horizon LLM agents, self-evolving agent harnesses, reinforcement learning for LLMs, and post-training**. Experienced in RLVR, policy optimization, and improving RL training efficiency. Builds self-evolving agents that use tools, interact with environments, complete long-horizon tasks, and improve through execution feedback. Research has been published at leading conferences and journals, including ICML, ICLR, COLM, and TMLR.

EDUCATION

Indiana University — Aug. 2022 to Feb. 2027 (expected)
Ph.D. in Computer Engineering — *Bloomington, IN*

Indiana University — Aug. 2022 to Dec. 2024
M.S. in Computer Engineering — *Bloomington, IN*

CORE EXPERTISE

Agentic RL, Evals & Environments	Tool-using terminal agents; long-horizon execution; agent environments and runtime harnesses; evals, dense-reward graders, and reward signals; multi-agent coordination; failure and model-behavior analysis.
LLM Post-Training & RL	RLVR and policy optimization with GRPO and W-REINFORCE; verifiable rewards; dynamic batch scheduling; reasoning optimization; training-signal and model-behavior analysis.
Scalable Training & Systems	Python, PyTorch, Hugging Face Transformers, veRL, vLLM, Ray, and DeepSpeed; distributed multi-GPU training and inference; Docker, Apptainer, Slurm, and GPU clusters.

EXPERIENCE

Tencent AI Lab | Hunyuan Frontier Lab — May 2026 to Present
Full-Time Researcher | Agentic Reinforcement Learning; Self-Evolving Agents — *Bellevue, WA*

- **Long-horizon agent harness interpretability:** Introduced the Harness Handbook, a behavior-centric representation that maps high-level system behaviors to concrete implementation sites, making complex agent harnesses easier to navigate, audit, and modify.
- **Self-evolving long-horizon agent harnesses:** Developed RiseHarness, a model-specific framework that compares successful and failed runs, aligns runtime harness traces with agent trajectories and Harness Handbook mappings, and searches external designs to propose targeted harness changes. Repeated implementation checks and evaluations retain modifications that improve execution reliability without updating model weights.
- **Long-horizon agent evaluation:** Co-developed Long-Horizon-Terminal-Bench, a benchmark spanning nine task categories with dense, process-level grading for evaluating frontier agents on extended terminal interactions.
- **Long-horizon agent task synthesis:** Co-developed Recursive Synthetic Terminal Tasks, a framework that recursively generates and validates tasks in fresh sandboxes. Produced more than 37,000 verified tasks for agentic RL, improving performance across multiple terminal-agent benchmarks.
- **Scientific agent environment scaling:** Co-developed software-in-the-loop reconstruction, which turns executable scientific workflows into self-supervised terminal tasks with hidden semantic verification. Built SWR from 500 workflows across 46 software families and six scientific domains.
- **Recursive trajectory self-improvement:** Co-developed Recursive Self-Rewrite, which uses planner, critic, and executor roles to convert successful trajectories from specialized harnesses into verified demonstrations for a general harness. Expanded the training set from 2,001 source trajectories to more than 11,000 verified trajectories.
- **Long-horizon terminal-agent RL:** Co-developed T1, a 122B Mixture-of-Experts agent post-trained with reinforcement learning for real-shell tasks requiring hundreds of tool interactions. Designed dense process rewards and TITO/R3 training-inference alignment to improve reliable long-horizon execution.
- **Recursive agent post-training:** Co-developed Terminal-RSI, a self-improvement framework that alternates recursive trajectory rewriting with critic-inheriting policy refinement. Developed turn-boundary credit assignment and

success-prioritized rewards for stable learning on long terminal tasks.

Indiana University | Machine Learning Lab Aug. 2023 to Present

Graduate Researcher; Advisor: Prof. Dongruo Zhou *Bloomington, IN*

- **Reliable memory-based agent self-improvement:** Identified error reproduction, where faulty stored abstractions shape later trajectories and regenerate errors through subsequent memory updates. Developed Anti-Persistence to retain execution experience while synthesizing task-specific guidance on demand, improving held-out success with the lowest average LLM-call cost among evaluated memory designs.
- **Efficient RLVR:** Identified sparse gradient signals in LLM reinforcement learning and developed dynamic batch scheduling, reducing optimizer updates by up to 79% and wall-clock time by 9.3% while preserving Pass@k across three LLMs, four benchmarks, and three RL algorithms.
- **Federated LLM reasoning:** Developed FERA to combine reasoning from distributed LLMs without training, outperforming baselines on MMLU-Pro, AQUA-RAT, and GSM8K while using approximately 88% fewer FLOPs than FedAvg and 64% fewer than FLoRA.
- **Collaborative LLM agents:** Developed Fed-ICL to improve answers without sharing model parameters or raw data, increasing MMLU accuracy by up to 11% and TruthfulQA BERTScore by up to 8% while converging in 40% to 88% fewer rounds than FedAvg.
- **Multimodal agentic recommendation:** Designed an architecture that integrates user profiles, memory, planning, actions, multi-agent collaboration, and interactive user simulation, and identified seven open challenges for next-generation systems.
- **Offline and safe RL:** Developed RADT for policy transfer across changing dynamics and CQDT for trajectory stitching under safety constraints, with theoretical guarantees and evaluations on D4RL and safe offline RL benchmarks.

Mitsubishi Electric Research Laboratories May 2024 to Aug. 2024

Ph.D. Research Intern | Generative AI *Cambridge, MA*

- **Generative AI for few-shot learning:** Developed three label-guided quantum diffusion algorithms that achieved 79.5% mean accuracy, a 17.3% relative improvement over the strongest QNN baseline across 12 tasks; validated them on noisy IBM Almaden hardware, leading to publications at ICAD 2025 and the AAAI QCAI Workshop.
